Application/Control Number: 10/614,757

Art Unit: 2817

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1 & 4 are rejected under 35 U.S.C. 102(b) as being anticipated by Kobayashi et al.

Refer to figs. 15A & 15B of Kobayashi et al., described beginning at line 5 of col. 16 of their disclosure. Referring to fig. 15A first with respect to claim 1, input differential amplifier stage 11 will inherently include at least two transistors that may be read on the first and second transistors claimed and generate amplified signals 11,12 that may be read as the first and second amplified signals claimed. These signals are again amplified by output transistors Tr10,Tr11 that may be read as the third and fourth transistors claimed. Current detector circuit 28 shown is shown in more detail in fig. 15B and includes transistors Tr1-Tr4 that may be read on the detecting means claimed as they will detect the output signals of the input differential amplifier stage 11 and generate signals (that may be read as the first and second detection signals) that control transistors Tr7,Tr9 which may be read as the load drivability control means claimed since they will set the through current It flowing through the output transistors in accordance with the detected signals (see fig. 16 and lines 50-55 of col. 16). In regard to claim 4, transistors Tr7, Tr9 also meet the limitations of this claim and may be read as the first and second control means respectively as they receive the detection signals to

control the respective output transistor drivability. (Tr7 controls Tr10 via mirror transistor Tr12 and Tr9 controls Tr11 via mirror transistor Tr13).

Claims 2,3 & 5-10 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The specific detection circuitry of claim 2 and multiple transistor control means of claims 5 and 8 are not disclosed by Kobayashi et al.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Steven J. Mottola whose telephone number is 571-272-1766. The examiner can normally be reached on M-Th from 8 to 5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Robert J. Pascal, can be reached on 571-272-1769. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
